<u>Abstract</u>- The deoxygenation reaction of 4-nitro-3-styrylpyridine 1-oxides with triethyl phosphite or, more favourably, with hexa-alkylphosphorous triamide afforded 1,1'-bi-lH-pyrrolo[3,2-c]pyridines instead of a monomeric product.

The N-N bonded dimers of pyrroles, ² indoles, ³ and carbazoles ⁴ have been prepared by the oxidation reaction of the corresponding heterocycles. We wish to report that the deoxygenation reaction of 4-nitro-3-styrylpyridine 1-oxides with tervalent phosphorus compounds produces the N-N bonded dimers in moderate yields. This appears to be a rare instance in the deoxygenation reactions of nitro-arenes.⁵

Whereas 4-nitro-3-styrylpyridine 1-oxide (la), when heated in a large excess of triethyl phosphite, gave 1-ethyl-2-phenyl-1H-pyrrolo[3,2-c]pyridine (2) [mp 198-199°, 29 % yield], heating of (la) with 6 moles of triethyl phosphite in benzene for 7 days (the conditions reported to yield 2-phenyl-1H-pyrrolo[3,2-c]pyridine from (la) 7) afforded a compound $^{C}_{26}$ H₁₈N₄ [mp 266-268° (decomp.), 6 % yield].

 1 H Nmr spectrum of this compound displays aromatic protons only whose chemical shifts and coupling constants are in keeping with those recorded for pyrrolo[3,2-c] pyridines and the spectral pattern did not change after the addition of deuterium oxide, indicating the absence of protons exchangeable with deuteriums. This is further supported by the absence of a ν (NH) absorption in its ir spectrum, which contains bands characteristic of pyrrolo[3,2-c]pyridine. From these observations the structure of 2,2'-diphenyl-1,1'-pyrrolo[3,2-c]pyridine (3a) was assigned.

The synthesis could be advantageously improved when (la) was heated with 6 moles of hexamethyl- or hexaethyl-phosphorous triamide in $\underline{\text{tert}}$.-butylbenzene or xylene at 130 $^{\circ}$ in nitrogen for a few hours (a vigorous reaction took place at
